13. ABSTRACT (Maximum 200 words)		
<p>The long range goal of this project was to quantify the dynamical mechanism responsible for the exchange of mass, momentum and energy between the coastal and open oceans. Nonlinear mechanisms operating on sub-grid scales, dynamically consistent and quantitative methods for interpreting quasi-Lagrangian data, and nonlinear/nonquasigeostrophic flows were the main study. The first was to determine the role of secondary circulation on the exchange between the coastal and open oceans. The second was to determine how ocean eddies produce super inertial fluctuations in hydrodynamic fields. As documented in the scientific literature, considerable progress was made on these questions. It is expected that this research contributes to improved parameterizations of sub-grid scale processes and to efficient utilization of quasi-Lagrangian data.</p>

GENERAL INSTRUCTIONS FOR COMPLETING SF 298

The Report Documentation Page (RDP) is used in announcing and cataloging reports. It is important that this information be consistent with the rest of the report, particularly the cover and title page. Instructions for filling in each block of the form follow. It is important to **stay within the lines** to meet **optical scanning requirements**.

Block 1. Agency Use Only (Leave blank).

Block 2. Report Date. Full publication date including day, month, and year, if available (e.g. 1 Jan 88). Must cite at least the year.

Block 3. Type of Report and Dates Covered.

State whether report is interim, final, etc. If applicable, enter inclusive report dates (e.g. 10 Jun 87 - 30 Jun 88).

Block 4. Title and Subtitle. A title is taken from the part of the report that provides the most meaningful and complete information. When a report is prepared in more than one volume, repeat the primary title, add volume number, and include subtitle for the specific volume. On classified documents enter the title classification in parentheses.

Block 5. Funding Numbers. To include contract and grant numbers; may include program element number(s), project number(s), task number(s), and work unit number(s). Use the following labels:

C - Contract	PR - Project
G - Grant	TA - Task
PE - Program Element	WU - Work Unit
	Accession No.

Block 6. Author(s). Name(s) of person(s) responsible for writing the report, performing the research, or credited with the content of the report. If editor or compiler, this should follow the name(s).

Block 7. Performing Organization Name(s) and Address(es). Self-explanatory.

Block 8. Performing Organization Report Number. Enter the unique alphanumeric report number(s) assigned by the organization performing the report.

Block 9. Sponsoring/Monitoring Agency Name(s) and Address(es). Self-explanatory.

Block 10. Sponsoring/Monitoring Agency Report Number. (If known)

Block 11. Supplementary Notes. Enter information not included elsewhere such as: Prepared in cooperation with...; Trans. of...; To be published in.... When a report is revised, include a statement whether the new report supersedes or supplements the older report.

Block 12a. Distribution/Availability Statement.

Denotes public availability or limitations. Cite any availability to the public. Enter additional limitations or special markings in all capitals (e.g. NOFORN, REL, ITAR).

DOD - See DoDD 5230.24, "Distribution Statements on Technical Documents."

DOE - See authorities.

NASA - See Handbook NHB 2200.2.

NTIS - Leave blank.

Block 12b. Distribution Code.

DOD - Leave blank.

DOE - Enter DOE distribution categories from the Standard Distribution for Unclassified Scientific and Technical Reports.

NASA - Leave blank.

NTIS - Leave blank.

Block 13. Abstract. Include a brief (**Maximum 200 words**) factual summary of the most significant information contained in the report.

Block 14. Subject Terms. Keywords or phrases identifying major subjects in the report.

Block 15. Number of Pages. Enter the total number of pages.

Block 16. Price Code. Enter appropriate price code (**NTIS only**).

Blocks 17. - 19. Security Classifications. Self-explanatory. Enter U.S. Security Classification in accordance with U.S. Security Regulations (i.e., UNCLASSIFIED). If form contains classified information, stamp classification on the top and bottom of the page.

Block 20. Limitation of Abstract. This block must be completed to assign a limitation to the abstract. Enter either UL (unlimited) or SAR (same as report). An entry in this block is necessary if the abstract is to be limited. If blank, the abstract is assumed to be unlimited.

PROJECT TITLE: Quantitative Use of Lagrangian Data in Numerical Models
 PRINCIPAL INVESTIGATORS: A. D. Kirwan, Jr. and B. L. Lippardt, Jr.
 INSTITUTION: Center for Coastal Physical Oceanography
 Old Dominion University
 ADDRESS: 768 West 52nd Street, Norfolk, Virginia 23529
 TELEPHONE (voice): (804) 683-4945
 TELEPHONE (fax): (804) 683-5550
 EMAIL: adk@ccpo.odu.edu, bruce@ccpo.odu.edu
 CONTRACT NUMBER: N00014-95-1-0803
 CONTRACT START, END DATES: 1 April 1995, 30 September 1996
 SUMMARY SUBMISSION DATE: November 14, 1995

OBJECTIVE:

An unprecedented amount of Lagrangian data is now being collected by oceanographers. The general feeling is that such data are important for an accurate description of ocean circulation. Regrettably, little hard analysis has gone into deployment strategies and even less into quantitative use of Lagrangian data after it has been collected. This is unfortunate, since such data can enhance numerical modeling efforts through data assimilation, which makes explicit use of the data's Lagrangian character. These data can also be used to assess a model's ability to predict the evolution of transient events.

The long range objective of this project is to develop theoretically based quantitative procedures for utilizing Lagrangian data for both of these applications. The focus of this phase of the effort will be on using both surface and subsurface Lagrangian data for a quantitative assessment of circulation models.

APPROACH:

The approach used here is an improvement of that used by Eremeev *et al.* (*Jour. Geophys. Res.* 97: 9733-9753, 1992). This is summarized briefly here.

The basis for the procedure is a general Eulerian representation of any hydrodynamic field Γ^r as:

$$\Gamma^r(\mathbf{x}, \eta, t) = \sum_{k=1}^K A_k^r(\eta, t) \Gamma_k^r(\mathbf{x}, t) \quad (1)$$

Here, the superscript r could represent components of the velocity field and η is a surface that is a characteristic of either a model or the Lagrangian observations. This might be depth for a numerical model, and an isopycnal or isobaric surface for data. The Lagrangian representation of the same field simply replaces the horizontal position \mathbf{x} with the path data \mathbf{x}^p for Lagrangian probe p .

The key issue is the specification of the basis function Γ_k^r in (1). A number of

options are available, but the one most appropriate for this effort is to utilize a representation of the velocity field as:

$$\mathbf{u} = \nabla \times [\mathbf{n}\psi + \nabla \times (\mathbf{n}\phi)] \quad (2)$$

where \mathbf{n} is normal to η . Projection of \mathbf{u} and $\nabla \times \mathbf{u}$ onto η give:

$$\mathbf{n} \cdot \mathbf{u} = -\nabla \cdot [(\mathbf{n} \cdot \mathbf{n}) \nabla \phi - \mathbf{n} (\mathbf{n} \cdot \nabla \phi)]$$

$$\mathbf{n} \cdot (\nabla \times \mathbf{u}) = \mathbf{n} \cdot \nabla_H^2 (\mathbf{n} \times \nabla \phi) - \nabla \cdot [(\mathbf{n} \cdot \mathbf{n}) \nabla \psi - \mathbf{n} (\mathbf{n} \cdot \nabla \psi)] \quad (3)$$

The solution of (3) involves eigenfunctions of a Poisson problem which ensure no slip and no normal flow at the domain boundaries - typical numerical modeling constraints. These eigenfunctions are the basis functions Γ_k^r in (1). They can be calculated (with some difficulty and care) for any given model geometry. Once determined, they are used for both model output and observations.

PROGRESS SUMMARY:

We have been working on this project for less than 6 months, so only preliminary results are available. Although the approach described above is well documented in the literature, there is precious little experience with applications. In order to develop some focus, we elected to first apply the method to enclosed or nearly enclosed basins with a substantial amount of Lagrangian data. We have succeeded so far in the first task of developing numerical methods for calculating the eigenfunctions in (1) above for no slip boundary conditions.

APPLICATIONS:

When developed, this technology will impact naval operations in two ways. First, it will provide a powerful quantitative tool for comparing circulation model predictions with Lagrangian observations. This would assist in the interpretation of data from transient events and provide a more powerful method for assessing model performance than is currently used. Second, it will provide a means for assimilating drifter and float data into predictive models. Such a development would correct a long-standing problem with present assimilation methods, which don't take full advantage of the Lagrangian character of the data.
